

SE 216 – SOFTWARE PROJECT MANAGEMENT
STAKEHOLDERS DOCUMENT

PROJECT NAME: Happy Tails

GROUP MEMBERS: Semih Öztürk, Mirza Kerem Kılıç, Melike Gülmüne Kırpat,
Özge Öztürk, Hüseyin Günçiçek, Arda Özkaranfil, İdil Buse Zengin

#	STAKEHOLDER	DESCRIPTION
1	Volunteers	If the project succeeds, volunteers will be able to follow the daily needs of shelters through the platform and provide ongoing support such as donating food and supplies, watching the livestream to monitor animal welfare, and reporting urgent situations to shelter staff. Volunteers can support the project by using the platform regularly to contribute resources, sharing the application within their communities to expand its reach, and helping shelters maintain better conditions through continuous, long-term involvement.
2	Animal Shelters	If the project succeeds, it will be easier for animal shelters to be in touch with the volunteers, schedule the adoption of the animals, and raise donations, which will allow shelters to provide better conditions. Animal shelters can support the project by effectively using the donation collection, adoption scheduling, and livestream features.
3	Veterinary Professionals	If the project succeeds, veterinary professionals will be able to track the medical data of the animals in the shelters from a uniform system. Veterinary professionals may provide the data for the "Medical Management" module and require accurate records for treating animals in the shelter.
4	Potential Adopters	If the project succeeds, potential adopters will be able to discover animals across multiple shelters in one place, use AI-based recommendations to find a pet that matches their lifestyle, and book adoption appointments without needing to visit shelters one by one. Adopters can support the project by completing the compatibility survey accurately and using the appointment scheduling system to finalize adoptions, though they may face frustration if technical errors occur during booking or if recommended matches do not meet their expectations.

5	NGOs and Student Clubs	If the project succeeds, animal welfare NGOs and university student clubs will be able to extend their existing field activities into a unified digital ecosystem, where the animals they care for in their local environments can be registered, tracked, and connected to a wider community of adopters and donors. NGOs and student clubs can support the project by contributing to animal profiles with the data they collect through their own initiatives, such as collar-mounted QR codes linking to vaccination and health records, and by encouraging their members to actively use the platform to expand its reach, although differences in their working methods across regions may create inconsistencies in the data they provide.
6	Animal Trainers and Behaviorists	If the project succeeds, animal trainers and behaviorists will be able to access detailed animal profiles, including arrival stories and behavioral notes, allowing them to prepare tailored training plans before adopters take their pets home. Trainers and behaviorists can support the project by contributing behavioral assessments to animal profiles and providing professional input to the AI compatibility matching algorithm, although inconsistencies in their assessment methods may affect the reliability of recommendations across different shelters.
7	Municipalities	If the project succeeds, regulatory bodies will be able to monitor shelter activities and adoption statistics more transparently. They can support the project by verifying compliance with data protection standards, although they may impose strict legal requirements that could delay deployment.
8	Ministry of Agriculture and Forestry	If the project succeeds, the Ministry of Agriculture and Forestry will be able to monitor shelter operations and adoption activities more transparently through a centralized digital platform, supporting their oversight role in animal welfare across the country. The Ministry can support the project by providing regulatory guidance and verifying compliance with national animal welfare standards,

		although they may impose strict legal or reporting requirements that could delay deployment.
9	Local Businesses	If the project succeeds, local businesses will be able to reach a targeted audience of animal lovers and provide specialized discounts or "welcome kits" for newly adopted pets. Local Businesses can support the project by offering financial sponsorship or providing essential supplies (food, toys, leashes) in exchange for visibility on the platform's donation and story modules.
10	Donors and Suppliers	If the project succeeds, donors will be able to assign their contributions to specific animals and track how their support is used, while suppliers will be able to establish long-term service contracts and use the project as a reference for their hardware and cloud solutions. Donors can support the project by providing financial contributions or material resources such as food, medicine, and toys, and suppliers can support it by providing reliable cameras for live monitoring and stable hosting services. However, donors may withdraw support if data security concerns arise regarding their transactions, and suppliers may cause delays if their delivery schedules or technical support do not meet project requirements.
